SECTIONAL BODY

Series “20”

STANDARD FEATURES

• 1 -10 Work Sections
• Power Beyond Capability
• Load Checks on Each Work Port
• A Float Section can be Installed in any Location in Valve Assembly
• Interchangeable Mounting With Other Popular “20” gpm Stack Valves
• Optional Work Section with Pilot Operated Checks

SPECIFICATIONS

Parallel or Tandem Circuit Pressure Rating
Maximum Operating Pressure ...... 3500 psi
Maximum Tank Pressure................. 500 psi

Nominal Flow Rating ................. 20 gpm
Please Refer to Pressure Drop Charts.
Allowable Pressure Loss thru Valve Determines the Maximum flow.

Foot Mounting
Weight
Inlet Cover ......................... Approx 6 lbs
Outlet Cover ....................... Approx 3.5 lbs
Work Section ...................... Approx 9 lbs

Maximum Operating Temp .......... 180°F

Filtration: For general purpose valves, fluid cleanliness should meet the ISO 4406 19/17/14 level. For extended life or for pilot operated valves, the 18/16/13 fluid cleanliness level is recommended.
ORDERING INFORMATION:
The following is a listing of valve sections available from stock on a standard basis.

STANDARD INLET SECTIONS
ALL SECTIONS HAVE BOTH TOP AND SIDE INLET AND TANK PORTS

SEE PAGE 11, 12 & 13 OF THE STANDARD PRODUCT PRICE LIST FOR PRICING
SPECIAL SECTIONS AVAILABLE:
Valves other than standard models listed can be made to order. Use order code Matrix below to generate a model number that meets your requirements. If you prefer, contact your Sales Representative with your specific requirements and a model number will be assigned for you. This model number can then be used for future orders. A minimum order quantity will apply to special valves. Please consult Sales Representative.

**WORK SECTION**

**WORK SECTION TYPE**
P - STANDARD PARALLEL

N - STANDARD OUTLET

**SPOOL ACTIONS**
A - SPRING CENTER TO NEUTRAL  
B - 3 POSITION DETENT  
C - FRICTION DETENT  
D - FLOAT DETENT  
E - SPRING CENTER PNEUMATIC ACTUATOR  
F - 2 POSITION DETENT NEUTRAL & OUT (NO IN POSITION)  
G - HYDRAULIC ACTUATOR (USE HANDLE OPTION 7)  
H - SPRING CENTER W/ MICROSWITCH (SWITCHES ON IN OR OUT)***  
I - SPRING CENTER W/ MICROSWITCH (SWITCHES ON SPOOL IN ONLY)***  
J - SPRING CENTER T/NEUTRAL & OUT (NO IN POSITION)  
K - SPRING CENTER W/ MICROSWITCH  
L - SPRING CENTER DETENT OUT  
M - SPRING CENTER DETENT IN  
N - SPRING CENTER DETENT OUT  
P - 2 POSITION DETENT NEUTRAL & IN (NO OUT POSITION)

**HANDLE OPTIONS**
1 - STANDARD LEVER HANDLE*  
2 - LESS HANDLE ONLY  
3 - LESS COMPLETE HANDLE  
4 - VERTICAL LEVER HANDLE*  
7 - BLANK FOR OPTIONAL JOYSTICK HANDLE

**INLET SECTION**

**INLET TYPE**
I - STANDARD INLET

**PORT SIZE**
1. #10 SAE (7/8-14 THREAD)  
2. #12 SAE (1 1/16-12 THREAD)  
3. 3/4 NPTF (2000 PSI MAX)

**RELIEF OPTION**
Blank - LEAVE BLANK FOR INLET WITHOUT RELIEF OR RELIEF PLUG  
A - NO RELIEF PLUG  
B - SHIM ADJUSTABLE RELIEF 500-1350 PSI  
C - SHIM ADJUSTABLE RELIEF 1351-1750 PSI  
D - SHIM ADJUSTABLE RELIEF 1751-2200 PSI  
E - SHIM ADJUSTABLE RELIEF 2201-3000 PSI  
F - ADJUSTABLE RELIEF 500-1350 PSI  
G - ADJUSTABLE RELIEF 1351-1750 PSI  
H - ADJUSTABLE RELIEF 1751-2200 PSI  
J - ADJUSTABLE RELIEF 2201-3000 PSI  
K - ADJUSTABLE RELIEF 3001-3500

**OUTLET SECTION**

**OUTLET TYPE**
E - STANDARD OUTLET

**PORT SIZE**
1. #10 SAE (7/8-14 THREAD)  
2. #12 SAE (1 1/16-12 THREAD)  
3. 3/4 NPTF (2000 PSI MAX)

**EXHAUST OPTIONS**
1 - STANDARD OPEN CENTER OUTLET WITH CONVERSION PLUG  
2 - POWER BEYOND OUTLET WITH #10 SAE POWER BEYOND PORT  
3 - CLOSED CENTER OUTLET*  
4 - STANDARD OPEN CENTER WITH SOLENOID PILOT LINE SEALS  
* Often used with no relief. Review application

**VALVE ASSEMBLIES**
The Series 20 sectional body directional control valve can be ordered as separate sections as outlined or as a complete factory tested assembly. This will need to be specified with each order. An assembly model number will be assigned at the time of the order. This assembly number can then be used for future orders.

**ASSEMBLY MODEL NUMBER 20A - X X X**

XXX = Sequence of Numbers. This number will be assigned to final valve to be assembled and tested at the factory. Each new order or quote will be assigned a new assembly model number.
**SPOOLS AND SPOOL ATTACHMENTS**

**OPTION N - DETENT**
SPOOL-OUT W/ SPRING CENTER

**OPTION A - SPRING CENTER TO NEUTRAL**

**OPTION B - 3 POSITION DETENT**

**OPTION D - FLOAT DETENT WITH SPRING CENTER**

**SPOOL OPTION A** - 3 WAY 3 POSITION FOR USE WITH SINGLE ACTING CYLINDERS OR NON-REVERSIBLE MOTORS. THE 'B' WORK PORT IS BLOCKED IN NEUTRAL.

**SPOOL OPTION B** - 4 WAY 3 POSITION FOR USE WITH DOUBLE ACTING CYLINDERS OR REVERSIBLE MOTORS. THE WORK PORTS ARE BLOCKED IN NEUTRAL.

**SPOOL OPTION C** - 4 WAY 3 POSITION FREE FLOW MOTOR SPOOL. THE WORK PORTS ARE OPEN TO TANK IN NEUTRAL, ALLOWING A MOTOR TO COAST OR A CYLINDER TO FLOAT.

**SPOOL OPTION D** - 4 WAY 4 POSITION FLOAT. SAME AS 4 WAY 3 POSITION WITH THE ADDITION OF A FOURTH POSITION FLOAT. THE SPOOL IS DETENTED IN THE FLOAT POSITION AND SPRING CENTERED TO NEUTRAL FROM THE 'A' OR 'B' POWER POSITION.
### CROSS SECTION OF TANDEM WORK SECTION AND LOCK SECTION

**TANDEM SECTION**

- The tandem section body has a "T" on the left side of the "B" work port.
- Shown with micro-switch option J.

**LOCK SECTION**

- The lock section body has an "L" on the left side of the "B" work port.
- The casting number "C-638" is on the right side of the work section body.
- The tandem section body has a "T" on the left side of the "B" work port.

### MODEL 20P PARALLEL CIRCUIT

Parallel circuit construction is the most common. When any one of the spools in a valve bank is shifted it blocks off the open center passage. The oil then flows into the parallel circuit core making oil available to all spools. If more than one spool is fully shifted then oil will go to the section with the lowest pressure requirements. It is possible, however, to meter flow to the spool with the least load and power two unequal loads. The schematic below shows a three section parallel circuit stack valve.

**THE POWER CORE OF ALL SECTIONS IN THE VALVE STACK ARE CONNECTED TOGETHER BY THE PARALLEL CORE THAT RUNS THROUGH THE LENGTH OF THE VALVE**

### MODEL 20T TANDEM CIRCUITS

Tandem circuit construction is also referred to as priority circuit. When the spool of a section is shifted, oil is cut off to all downstream sections. Thus the section nearest to the inlet has priority over the other sections in the valve bank. If more than one spool is fully shifted all the oil will go to the section nearest to the inlet. Metering the upper stream section will allow two sections to operate at the same time. The schematic below shows a three section tandem circuit stack valve.

**THE POWER CORE OF A WORK SECTION IS FED BY THE OIL EXITING THE OPEN CENTER OF THE ADJACENT UPSTREAM WORK SECTION**

### COMBINED PARALLEL/TANDEM CIRCUITS

Parallel and tandem circuit work sections can be combined in the same valve bank. Below the 1st and last sections are parallel and the 2nd is tandem. The 1st parallel section has priority over the other two. The 3rd and 3rd sections are in parallel with each other. If the spool of the 1st section is shifted it will cut off oil to the other two. If the spools of the 2nd and 3rd section are both shifted oil will go to the one with the least resistance. It should be noted that it is the section just prior to the tandem section that has priority, not the tandem section. Further if a parallel section is placed just after a tandem, the two sections will be in a parallel.

**20P PARALLEL WORK SECTIONS**

**20T TANDEM WORK SECTION**

### LOAD CHECK

Each work port of the Series 20 stack valve has a separate load check. The load check prevents the fall of a cylinder as the spool is shifted. It also prevents the back-flow of oil from the work port to the inlet. The pump must build up enough pressure to overcome the pressure on the work port caused by the weight of the load before the cylinder can move.

**PLEASE NOTE** that the load check has nothing to do with how well the valve will hold up a cylinder with the spool in neutral. The load check is functional only when the spool is shifted.

### OPEN CENTER APPLICATIONS

The standard Series 20 stack valve is open center. When the spools are in neutral hydraulic oil is directed from the inlet to the outlet (or power beyond) through the open center core. Moving one or more spools closes off the open center core and directs oil to the work ports. Open center systems most often contain fixed displacement pumps like the Prince SP series gear pumps.

**PLEASE NOTE** that the maximum pressure in an open center system is controlled by a relief valve. The Series 20 inlet sections are available with a built in inlet relief for this purpose.

### CLOSED CENTER APPLICATIONS

The Series 20 stack valve can be converted to closed center by adding the closed center plug to the outlet section. This blocks off the open center core when the spools are in neutral. These systems often use a variable displacement pressure compensated pump that limits the maximum pressure. When spools are in neutral system pressure is maintained at inlet of the valve. A relief is normally not required or must be set at a higher pressure than the pump compensator.

**PLEASE NOTE** that this closed center option does not provide for the drain off of standby spool leakage. This can allow a very small amount of oil to enter the work ports when in neutral.
A series circuit valve is most commonly used to control more than one hydraulic component simultaneously. The entire circuit flow is available to each valve section that is actuated. In a two spool series valve with both spools actuated, the oil flows from the inlet to the work port of the first section. The return flow of the first section is directed to the open center core of the second section. (In a parallel valve the return oil from the work port is directed to the tank core.) From the open center core of the second section, the oil flows to the work port with the return oil going to the outlet. In a series circuit valve, the summation of the pressures required for each work section will equal the total pressure required for the circuit. The total pressure required must not exceed the system relief setting for the pump pressure rating. It is not required to have a Series 20 series section as the last section, unless series flow is required to a downstream valve. In this application, a power beyond plug must be used in the outlet section.

The Series 20 series sections may be stacked with 20P parallel circuit valve sections. When using a series section, the immediate downstream section needs to be a series, tandem, or outlet section. 20P sections can be either in front of the Series 20 series sections or behind a combination of series and tandem sections.

For solenoid operation with series sections and a 20U utility section, there needs to be a Series 20 tandem section with pilot passageways between the series section and the utility section.

In the valve assembly shown below, the first and fourth sections are parallel. The second section is series, the third section is tandem. The first parallel section has priority over all downstream valves. When the spool of the first parallel section is actuated, the return oil from the work port is directed to the tank core, thus oil flow to downstream sections is cut off. The second and third sections are in series with each other as well as the second and fourth sections. The third and fourth sections are in parallel with each other.

The Series 20 Series circuit valve sections cannot be used in a closed center valve assembly.
**WORK PORT RELIEF CARTRIDGES**

**OPTION K ANTI-CAVITATION CHECK**
This option allows oil to be drawn from the tank core into the work port if there is a vacuum on the work port. This vacuum would be caused by a overrunning motor or cylinder. The check will be open whenever the pressure in the tank core is higher than that in the work port.

**OPTIONS B, C, D, AND E, SHIM ADJUSTABLE PORT RELIEF**
A port relief can be installed to limit the pressure at the work port to less than the system pressure. Also, it can be installed to provide spike pressure protection when the spool is in the neutral position. The pressure of these reliefs can be changed by changing shims.

**OPTIONS F, G, H, AND J, ADJUSTABLE PORT RELIEF**
This is the same differential poppet type relief as above but externally adjustable within the specified range.

**OUTLET SECTION OPTIONS**

**OPTION 1 STANDARD OPEN CENTER WITH CONVERSION PLUG**
This is the standard outlet option. This option allows for conversion in the field for power beyond or closed center applications. When the spools are in neutral the inlet is unloaded to tank.

**OPTION 3 CLOSED CENTER OUTLET**
This option provides for closed center operation. This is typically used with a variable displacement pressure compensated pump or in a system with an unloading valve. When the spools are in neutral the inlet port is blocked.

**OPTION 2 POWER BEYOND WITH #10 SAE BEYOND PORT**
This option provides for a high pressure power beyond port. This would be used if a valve is to be added downstream. The outlet must be connected to tank. When the spools are in neutral the inlet is connected to power beyond port.

**SERIES 20 COMBINATION 3 WAY AND COMBINED FLOW MID-INLET SECTION**

**HANDLE OPTIONS**

**NOTE: HANDLES ARE COATED WITH BLACK RUBBER**

**WORK PORT RELIEF**

*See Series 20 Tandem Center work section order code for additional options.*

Description: This section acts as a combination mid-inlet and 3 way 3 position section. The mid-inlet provides an inlet port for a second pump mid stream in the stack valve. The A port is the mid-inlet port and provides combined flow for this section and any downstream sections. The B port and the rest of the section function the same as a 3 way 3 position section. When shifted any upstream sections take priority of the main inlet flow over downstream sections. Both an inlet relief and a mid-inlet relief are required to provide relief protection when both upstream and downstream sections are shifted.

*See Series 20 Tandem Center work section for dimensional data.*

---

**INLET RELIEF CARTRIDGES**

**OPTION A NO RELIEF**
When no main inlet relief is required the no relief plug is installed. All inlet sections have the relief cavity machined so an inlet relief can be installed in the field.

**OPTIONS B, C, D, AND E, SHIM ADJUSTABLE INLET RELIEF**
These options provide for an internally shim adjustable main inlet relief. The relief is a hydraulically dampened differential poppet design. This provides for smooth quiet operation in a relief that is moderately tolerant to contamination. The pressure of these reliefs can be changed, within the specified range, by changing shims. This relief is also available with stainless steel relief springs, consult factory.

**OPTIONS F, G, H, AND J, ADJUSTABLE RELIEF**
This is the same relief as above except it is externally adjustable, within the specified range.

SERIES 20 FLOW CONTROL INLET SECTION

Pilot Operated Relief Adjustable From 2000-3500 PSI.
Standard Relief Setting: 2500 PSI @ 10 GPM

MANUAL (OPT ‘M’) DESCRIPTION:
This inlet incorporates a manually operated pressure compensated flow control. With the flow control knob turned fully in (clockwise), all of the inlet flow is diverted to the tank core. By turning the flow control knob counter-clockwise, the inlet flow directed to the power core will be proportionally increased. (Approximately 6 turns varies the controlled flow from no flow to 26 GPM. Maximum number of turns on flow control is approximately 8 turns.)

ELECTRO-PROPORTIONAL (OPT ‘P’) DESCRIPTION:
This inlet incorporates a solenoid operated, electrically variable pressure-compensated flow control. With no current going through the solenoid, all of the inlet flow is diverted to the tank core. By increasing the current through the solenoid, the flow being directed to the power core will be proportionally increased. (The current range is 400-1600 mA. At a current of 1600 mA max controlled flow is approximately 25 GPM.) Control current is provided via a controller card providing a PWM signal.

LOAD SENSE OUTLET SECTION

OUTLET TYPE

- LE - STANDARD LOAD SENSE OUTLET

PORT SIZE

1. #10 SAE (7/8-14 THREAD)
2. #12 SAE (1 1/16-12 THREAD)
3. 3/4 NPTF (2000 PSI MAX)

LOAD SENSE PORT OPTIONS

1. #4 SAE WITH DRAIN ORIFICE
2. #4 SAE WITHOUT DRAIN ORIFICE
3. OUTLET FOR USE WITH 20ILFS INLET
   (OUTLET SEALS FOR SOLENOID PILOT LINES)

The Prince LE outlet includes a load sense port in a cartridge that is installed in the section. There are two versions of the cartridge, one with a load sense line drain orifice and one without a drain orifice. There is normally a drain orifice in either the valve or the pump controls. Cartridges can be changed in the field to change the configuration. Power beyond is not available in a load sense system.

CROSS SECTION OF LOAD SENSE & LOAD SENSE PRESSURE COMPENSATED WORK SECTIONS

MODEL 20LP LOAD SENSE & 20LPC LOAD SENSE PRESSURE COMPENSATED CIRCUITS

The Series 20LP and 20LPC work sections are specifically designed to be used with a pressure-flow compensated pump, commonly known as a load sense pump. The valve is a parallel circuit, closed center design, where flow does not flow through the valve when the spools are centered. A load sense signal line must be connected to the load sense port on the pump and to the load sense port on the 20LE outlet section of the valve. The pressure-flow compensator portion of a load sense pump will maintain (within its flow and pressure limitations) an output pressure equal to the pressure at the load sense port plus the load sense differential pressure. The differential pressure is typically between 150 and 350 psi. The valve is designed so that when a spool is shifted, the pressure at the outlet flow port is presented to the valves load sense port. The valve incorporates logic and load sense check valves so that when multiple spools are shifted, the highest pressure of any of the work ports is directed to the load sense port. A load sense line bleed orifice needs to be present in either the Prince load sense outlet or the load sense pump controls. The bleed orifice will prevent high pressure from being trapped in the load sense line and sending false signals to the pump.

There are a number of benefits to load sense systems, one of the primary ones being in the metering of the flow to the work ports. Metering is typically accomplished when the flow passes through metering notches in the spool. In a load sense valve, the pressure that drives the flow through the notches is typically limited to the relatively low and nearly constant differential pressure. This relatively low differential pressure makes the notches more effective and gives more resolution in regard to spool travel versus flow out of the work port. Also, this “resolution” remains relatively the same regardless of the pressure required at the work port. The metering notches in the Prince load sense valve have been optimized to give excellent metering characteristics over an extended portion of the spool travel and over the full flow rating of the valve. The internal lands of the casting have also been machined to give repeatable, precise control to the metering characteristics. Another benefit to load sense valves is that, in the minimum flow mode, the pump only has to generate the rather low differential pressure thus saving energy as compared to typical open center or standard closed center systems.

The Series 20LPC load sense pressure compensated valve incorporates a pressure compensator upstream to the metering notches on the spool (“pre-comp”). With either a fully shifted or partially shifted spool, work port flow will remain constant regardless of changing load pressure requirements. Pressure compensated sections are particularly useful in applications where the metering of flow, with varying pressure and flow conditions is required. The 20LPC sections have flow rated spools that determine the maximum flow from the individual work section. For instance the maximum flow from a work sections with a J10 spool is 10 gpm. Metering notches extend to the full travel of the spool. The lower flow spools will provide increased flow vs. spool travel resolution. With parallel circuitry, multiple sections can be used simultaneously to meter flow. If the sum of the flow rating of the shifted spools is less than the flow rating of the pump, all sections will receive flow. If the call for flow based on spool position from all work sections calls for more flow than the output of the pump, there may be some division of flow based on the section with the lowest pressure demand. The 20LPC is an optimal choice for proportional solenoid operation. It provides the greatest resolution of all the Prince proportional solenoid valves.

WORK PORT FLOW VS. SPOOL POSITION

FLOW (GPM)

SPOOL DISPLACEMENT (IN)
SERIES 20 LOAD SENSE INLET (FOR FIXED DISPLACEMENT PUMP)

APPLICATION NOTES – 20ILF and 20ILFS:
1. These inlets are for use with a fixed displacement pump (such as a gear pump) and Prince Series 20 load sense sections.
2. When all spools are centered, the inlet allows the pump flow to be diverted to tank at relatively low pressure.
3. When a spool is shifted, the compensator directs the flow to the work port at a flow and pressure relative to the work port/load sense pressure. The inlet retains the enhanced metering control of the load sense work sections.
4. For the 20ILF inlet, the 150 psi compensator is standard. It is typically used with flows up to approximately 25 gpm. For lower flows, a 90 psi compensator can be used. For higher flows, a 230 psi compensator can be used. For the 20ILFS inlet, a 230 psi compensator is standard. In the 20ILFS, the compensator generates pilot pressure to initiate a spool shift when a solenoid is energized. Load induced pressure is required to complete and then maintain the spool shift.
5. For the 20ILFS, the flow to the solenoid card is filtered through a 5 µ replaceable cartridge pressure filter. Only the pilot flow is filtered thus providing a long filter life.
6. A Series 20 load sense outlet (20LEX1 for the 20ILF or a 20LEX3 for the 20ILFS) must be used in the stack valve assembly.
7. The load sense port on the outlet needs to be plugged with a steel plug. There is no external load sense line.

20ILF RELIEF CURVE
SET @ 10 GPM
This is a special handle for the SERIES 20 stack valve that allows the spools of two adjacent sections to be operated by one common handle. The spools can be operated independently or simultaneously depending on handle movement. The option is typically used on spring center to neutral sections. Normally, the handle is installed at the factory on sections ordered with handle option 7. However, the handle can also be installed in the field on valves originally equipped with standard handles (handle options 1 through 4). This drawing shows two joysticks with offset handles installed on a six section valve.

A typical handle to spool movement pattern is shown. Different patterns are also available. The Joystick handle can be used with standard three position spools or with four position float spools. If work port reliefs are required on the joystick end of a section, the relief cartridges must be the shim adjustable type. When two joysticks are installed on the same valve assembly, it is recommended that there be two standard section between them to prevent handle interference.

When ordering a valve assembly, please refer to the following part numbers and indicate which sections the handle is to be installed on. The part numbers refer to the complete joystick assembly required to control two valve sections. Use the same part numbers to order kits for field installation.

### SERIES 20 SOLENOID OPERATED WORK SECTIONS

The solenoid operated Series 20 work sections allow remote electrical on-off control or, depending on the model, manual control. The solenoid operated sections contain two, 3 way-2 position screw in style cartridge valves. The screw in cartridges provide a robust platform for the higher tank pressures often seen in mobile applications.

Prince solenoid operated valves are pilot operated valves where pilot pressure is used to shift the spool. Depending on the model, the pilot pressure will be applied either directly to the end of the spool or to a piston that is connected to the spool. When both solenoids are de-energized, both spool end cavities or piston cavities are connected to tank. When the “A” solenoid is energized, pilot pressure is applied to the “A” end of the spool/piston, causing the spool to shift, against spring bias, and allow flow to the “A” work port. Energizing the “B” solenoid causes similar action on the “B” end. Internal pilot passageways convey pilot pressure to the solenoid actuators.

Pilot pressure is typically supplied by a utility section, but in the case of load sense sections or closed center assemblies, it can also be provided by an inlet manifold, which can be provided with filtered pilot flow. If a utility section is used, it must be installed between the last work section and the outlet cover. The utility section, or inlet manifold, limit the pilot pressure to approximately 350 psi.

For an open center system, a pressure build up cartridge is needed in the utility section. The pressure build up section provides pilot pressure to initiate the spool shift. A minimum of approximately 300 psi load induced pressure is required to complete the spool shift and hold the spool in the shifted position. For over center or light load applications a restrictor installed in the work port line may be required. Manual sections used in the same assembly with solenoid sections must either be upstream of solenoid sections or be custom sections machined with pilot passage ways in an assembly using a utility section. In assemblies with an inlet manifold, both solenoid and manual sections can be in the same assembly but, manual sections may have to be machined with pilot pass through passageways. For solenoid operated series sections, a tandem section with pilot pass through passageways must be between the series section and the utility section. Consult your sales representative for your application.

Price solenoid operators are offered in both a divided design (a solenoid on each end of the section) and a combined design (both solenoids on the end opposite the handle). We also currently offer models in both 10 thread size and 8 thread size solenoid cartridges. The 8 thread size offers a more compact assembly and a more economical choice as compared to a 10 thread size.
A Series 20 solenoid operated section with a handle code of 1, 2, 3 or 4 will designate a combined configuration with both solenoid cartridges on one end, opposite the handle end of the section. The combined operator configurations provide for either electric or manual operation. Handle configurations will be the same as the standard manual sections. A "C" prefix on the solenoid and coil designation will designate an 8 series design and will have screw in solenoid cartridges with a #8 thread size. The #8 size cartridges allow for a more compact section size. An optional manual override feature is available for the #8 solenoid cartridges. Cartridges and coils on the 8 series are not interchangeable with the Prince 10 series solenoid sections or sections manufactured prior to November 2014. Any of the standard "-S", "-T", "-C" or "-D" style Prince Series 20 solenoid operated work sections may be used in any combination within a stack valve assembly.

SERIES 20 (8 SERIES) TYPE C - SOLENOID OR MANUAL WORK SECTION DIMENSIONS

See page 11, 12, 13 & 14 of the standard product price list for pricing
A Series 20 solenoid operated section with a handle code of 5 or 6 will designate a split configuration with a solenoid cartridge on each end of the section. Handle option 5 provides electric operation only. Handle option 6 provides a lever handle for either electric or manual operation.

A “D” prefix on the solenoid and coil designation will designate an 8 series design and will have screw in solenoid cartridges with a #8 thread size. The #8 size cartridges allow for a more compact section size. An optional manual override feature is available for the #8 solenoid cartridges. Cartridges and coils on the 8 series are not interchangeable with the Prince 10 series solenoid sections or sections manufactured prior to November 2014. Any of the standard “-S”, “-T”, “-C” or “-D” style Prince Series 20 solenoid operated work sections may be used in any combination within a stack valve assembly.

Note: Work port relief cartridges on the 20LP and 20S are different than the standard Series 20P cartridge.

*See page V38.5 for coil details.*
A Series 20 solenoid operated section with a handle code of 5 or 6 will designate a split configuration with a solenoid cartridge on each end of the section. Handle option 5 provides electric operation only. Handle option 6 provides a lever handle for either electric or manual operation.

An “S” prefix on the solenoid and coil designation will designate a 10 series design and will have screw in solenoid cartridges with a #10 thread size. Cartridges and coils on the 10 series will be interchangeable with the components on Prince solenoid operated valves manufactured prior to November 2014 as well as current production 10 series valves. The 10 series sections will have a dimensional envelope the same as Prince solenoid operated sections manufactured prior to November, 2014.

**10 SERIES SOLENOID OPERATED WORK SECTION**

### WORK SECTION TYPE
- **P** - Standard Parallel
- **LP** - Load Sense
- **LPC** - Load Sense Pressure Compensated
- **S** - Series (Use Spool Type N or P)

### PORT SIZE
1. #10 SAE (7/8-14 THREAD)
2. #8 SAE (3/4-16 THREAD)
3. #12 SAE (1 1/16-12 THREAD)
4. 1/2 NPTF (2000 PSI MAX)

### SPOOL TYPE
- **A** - 3 - Way 3-Position
- **B** - 4 - Way 3-Position
- **C** - 4 - Way 3-Position Free Flow Motor
- **H** - 3 - Way 3-Position - 20LP Only
- **J** - 4 - Way 3-Position - 20LP Only
- **K** - 4 - Way 3-Position Free Flow Motor - 20LP Only
- **N** - 4 - Way 3-Position Series
- **P** - 4 - Way 3-Position Series Motor
- **J05** - 5 GPM Pressure Comp (LPC Only)
- **J10** - 10 GPM Pressure Comp (LPC Only)
- **J15** - 15 GPM Pressure Comp (LPC Only)

### SPOOL ACTION
- **A** - Spring Center

### HANDLE OPTION
- **5**. Solenoid Operated Only (No Lever)
- **6**. Solenoid Operated With Manual Lever

**COIL VOLTAGE & TERMINATION**
- **12Q**, 12 VDC Double Spade
- **12L**, 12 VDC Double Wire
- **12H**, 12 VDC DIN 43650
- **24Q**, 24 VDC Double Spade
- **24L**, 24 VDC Double Wire
- **24H**, 24 VDC DIN 43650
- **11H**, 120 VAC DIN 43650

**PORT RELIEF “B” OPTION**
- **A** - Relief Cavity Plugged
- **B** - Shim Adjustable Relief 500-1350 PSI Set at 1350
- **C** - Shim Adjustable Relief 1351-1750 PSI Set at 1750
- **D** - Shim Adjustable Relief 1751-2200 PSI Set at 2200
- **E** - Shim Adjustable Relief 2201-3000 PSI Set at 2500

**PORT RELIEF “A” OPTION**
- **A** - Relief Cavity Plugged
- **B** - Shim Adjustable Relief 500-1350 PSI Set at 1350
- **C** - Shim Adjustable Relief 1351-1750 PSI Set at 1750
- **D** - Shim Adjustable Relief 1751-2200 PSI Set at 2200
- **E** - Shim Adjustable Relief 2201-3000 PSI Set at 2500

Note: Work port relief cartridges on the 20LP and 20S are different than the standard Series 20P cartridge.

*See page V38.5 for coil details.*
SERIES 20 UTILITY SECTIONS (FOR USE WITH SOLENOID OPERATED SECTIONS)

UTILITY SECTION

20 U X - X X X

UTILITY TYPE
U - Standard Utility

UTILITY OPTION
1. Solenoid On-Off Press. Build-Up Valve
2. Mechanical Continuous On Press. Build-up Valve
3. Closed Center Utility Section (Required with Load Sense Assembly)
4. Power Beyond Utility with #10 SAE Power Beyond Port *
5. External Pilot Supply Utility

* Note: With Series 20 solenoid operator assemblies, the power beyond line is connected to the utility section and NOT to a power beyond port in the outlet section.

COIL VOLTAGE & TERMINATION*
(omit for options 2 thru 5)
12Q, 12 VDC Double Spade
12L, 12 VDC Double Wire
12H, 12 VDC DIN 43650
12D, 12 VDC Deutsch
24Q, 24 VDC Double Spade
24L, 24 VDC Double Wire
24H, VDC DIN 43650
24D, 24 VDC Deutsch
11C, 120 VAC Conduit
11H, 120 VAC DIN 43650

COMBINATION OUTLET/UTILITY SECTION

20 U E X X X

OUTLET PORT SIZE
1. #10 SAE ORB (7/8 – 14 UNF)

PRESSURE BUILD-UP OPTIONS
2. Mechanical Pressure Build-Up
3. Closed Center
4. Mech. Pressure Build-Up; #12 SAE ORB Power Beyond
5. Mech. Pressure Build-Up, Medium Pressure; #12 SAE Power Beyond**
6. Mech. Pressure Build-Up, Medium Pressure***
7. #12 SAE ORB Power Beyond (No Pressure Build-Up)****

SERIES 20 SYMBOL SCHEMATIC OF A SOLENOID OPERATOR ASSEMBLY

SERIES 20 COMBINATION UTILITY SECTION AND OUTLET
Incorporates both the utility and outlet sections into one manifold.
For use in solenoid operated assemblies (either on/off or proportional).
Provides reducing cartridge (350 psi) limits pressure to solenoids.
Mechanical pressure build-up (open center or PBY), or closed center.
Optional filtration of pilot flow.
** Medium pressure buildups can be considered for higher flow proportional applications.
*** Build-up option 7 requires pilot pressure to be provided by downstream function.

FILTER OPTIONS
A - Without Filter Element
F - With Filter Element
(Cavity is always present)

SERIES 20 COMBINATION UTILITY SECTION
Incorporates both the utility and outlet sections into one mainfold.
For use in solenoid operated assemblies (either on/off or proportional).
Provides reducing cartridge (350 psi) limits pressure to solenoids.
Mechanical pressure build-up (open center or PBY), or closed center.
Optional filtration of pilot flow.
** Medium pressure buildups can be considered for higher flow proportional applications.
*** Build-up option 7 requires pilot pressure to be provided by downstream function.

Directional Control Valves

SECTIONAL BODY

Model SV

STANDARD FEATURES

- 1-10 Sections Per Valve Bank
- Load Checks On Each Section
- Hard Chrome Plated Spools
- Compact Construction
- Enhanced Metering Section Available in both the High and Low Sections
- Differential Poppet Style Relief, Adjustable from 1500 to 3000 psi (Also available in Low Pressure Version, Adjustable from 500 to 1500 psi)
- Power Beyond Capability
- Reversible Handle
- Mid-Inlet and Lock Valve Section available
- Flow Control Inlet

SPECIFICATIONS

Parallel or Series Circuit Construction
Pressure Rating
  - Maximum Operating Pressure ........ 3000 psi
  - Maximum Tank Pressure ............. 500 psi
Nominal Flow Rating .................... 12 GPM

Filtration: For general purpose valves, fluid cleanliness should meet the ISO 4406 19/17/14 level. For extended life or for pilot operated valves, the 18/16/13 fluid cleanliness level is recommended.

Foot Mounting
Maximum Operating Temp. .................. 180°F
Weight Per Section
  - Inlet Section ...................... Approx 3.75 lbs
  - Outlet Section .................... Approx 3.75 lbs.
  - Work Section (Standard) ........... Approx 5.50 lbs.
  - Work Section (High) ............... Approx 8.00 lbs.
**ORDERING INFORMATION:**
The following is a listing of valve sections available from stock on a standard basis.

**STANDARD SECTIONS AVAILABLE:**

### SPECIAL INLET AND OUTLET SECTIONS AVAILABLE:
Sections other than standard models listed can be made to order. Use order code Matrix below to generate a model number that meets your requirements. If you prefer, contact your Sales Representative with your specific requirements and a model number will be assigned for you. This model number can be used for future orders. A minimum order quantity will apply to special valves. Please consult Sales Representative.

### ORDERING INFORMATION:
The following is a listing of valve sections available from stock on a standard basis.

**STANDARD SECTIONS AVAILABLE:**

### INLET SECTIONS
**ALL HAVE BOTH TOP AND SIDE INLET PORTS**

<table>

### VALVE ASSEMBLIES
The Model SV sectional body directional control valve can be ordered as separate sections or as a complete factory tested assembly. This will need to be specified with each order. An assembly number will be assigned at the time of the order. This assembly number can then be used for future orders.

### ASSEMBLY MODEL NUMBER SVA-XXXX

XXXX = Sequence of Numbers. This number will be assigned to final valve to be assembled and tested at the factory. Each new order or quote will be assigned a new assembly model number. Please use quotation sheet at the end of SV section.
### SPECIAL WORK SECTIONS AVAILABLE:

Work Sections other than standard models listed can be made to order. Use order code Matrix below to generate a model number that meets your requirements. If you prefer, contact your Sales Representative with your specific requirements and a model number will be assigned for you. This model number can be used for future orders. A minimum order quantity will apply to special valves. Please consult Sales Representative.

### SPOOL ACTION

- A-Spring Center (SVW & SVL only)
- B-3 Position Detent
- C-Friction Detent
- D-Spring Center w/ Float Detent (SVH only)
- E-Light Spring Center
- F-2 Position Defent Neutral and Out (No In Position)
- G-2 Position Neutral and Out Spring Offset to Out
- H-2 Position Neutral and In Spring Offset to In
- J/S/C with MicroSwitch Bracket 2-Position*
- K/S/C with MicroSwitch Bracket 1-Position*
- M-Spring Center Detent In
- N-Spring Center Detent Out
- R-Spring Center Pneumatic Actuator
- S-Spring Center (SVR & SVG)

*MicroSwitch not provided

### HANDLE OPTION

1. Standard Lever Handle
2. Less Handle Only
3. Less Complete Handle Assembly
4. Adjustable Handle
5. Tang Spool End Only
6. Clevis Spool End Only
7. Vertical Handle
8. Blank for Optional Joystick Handle
9. Extended Enclosed Handle
10. Locking Handle

### SPOOL ACTION

- A-Spring Center (SVW & SVL only)
- B-3 Position Detent
- C-Friction Detent
- D-Spring Center w/ Float Detent (SVW only)
- E-Light Spring Center
- F-2 Position Detent Neutral and Out (No In Position)
- G-2 Position (Center and Spool Out) - Spring Loaded to Spool Out (Pressure to B Port) Position
- H-2 Position (Center and Spool In) - Spring Loaded to Spool In (Pressure to A Port) Position
- J-S/C with MicroSwitch Bracket 2-Position (MicroSwitch not provided)
- K-S/C with MicroSwitch Bracket 1-Position (MicroSwitch not provided)

### PORT RELIEF "B" OPTION

- A-Relief Cavity Plugged
- B-Non-Adjustable Direct Acting Relief 1500-3000 PSI
- C-Non-Adjustable Direct Acting Relief 500-1500 PSI
- D-Anti-Cavitation Check
- E-Adjustable Combination Port Relief/Anti-Cavitation Check 1000-2500 PSI***
- F-Non-Adjustable Combination Port Relief/Anti-Cavitation Check 1000-2500 PSI***
- G-Adjustable Direct Acting Relief 1500-3000 PSI
- H-Adjustable Direct Acting Relief 500-1500 PSI

### PORT RELIEF "A" OPTION

- A-Relief Cavity Plugged
- B-Non-Adjustable Direct Acting Relief 1500-3000 PSI
- C-Non-Adjustable Direct Acting Relief 500-1500 PSI
- D-Anti-Cavitation Check
- *E-Adjustable Combination Port Relief/Anti-Cavitation Check 1000-2500 PSI***
- F-Non-Adjustable Combination Port Relief/Anti-Cavitation Check 1000-2500 PSI***
- **G-Adjustable Direct Acting Relief 1500-3000 PSI
- **H-Adjustable Direct Acting Relief 500-1500 PSI
- **Cannot be used on work sections with float option due to interference with handle.

### CUSTOM SECTION

For OEM application custom sections can often be designed to meet your specifications. Special handles, spool, and spool actions are often easily made because of the SV valve’s flexible design. Consult your sales representative with your specifications.

---

**SPECIAL WORK SECTIONS AVAILABLE:**

- Work Sections other than standard models listed can be made to order.
- Use order code Matrix below to generate a model number that meets your requirements.
- If you prefer, contact your Sales Representative with your specific requirements and a model number will be assigned for you.
- This model number can be used for future orders. A minimum order quantity will apply to special valves.
- Please consult Sales Representative.

### WORK SECTIONS

- W-Std. Work Section
- M-Metering Work Section
- L-Work Section with Double P.O. Checks
- F-Fine Metering

### PORT SIZE

- 1. #8 SAE ORB (3/4-16 THD)
- 2. #6 SAE ORB (9/16-18 THD)

### SPOOL TYPE

- A-3-Way 3-Position
- B-4-Way 3-Position
- C-4-Way 3 Position Motor
- D-4-Way 4 Position Float
- E-4-Way 3 Position Metering (SVM only)
- F-3-Way 3 Position Metering (SVM only)
- J-4-Way 3 Position Fine Metering (SVM only)
- K-4-Way 3 Position Counterbalance Drain (SVM)
- M-4-Way 3 Position Counterbalance Drain/Motor (SVM)

### HANDLE OPTION

- 1. Standard Lever Handle
- 2. Less Handle Only
- 3. Less Complete Handle Assembly
- 4. Adjustable Handle
- 5. Tang Spool End Only
- 6. Clevis Spool End Only
- 7. Vertical Handle
- 8. Blank for Optional Joystick Handle
- 9. Extended Enclosed Handle
- 10. Locking Handle

### SPOOL ACTION

- A-Spring Center (SVW & SVL only)
- B-3 Position Detent
- C-Friction Detent
- D-Spring Center w/ Float Detent (SVW only)
- E-Light Spring Center
- F-2 Position Detent Neutral and Out (No In Position)
- G-2 Position (Center and Spool Out) - Spring Loaded to Spool Out (Pressure to B Port) Position
- H-2 Position (Center and Spool In) - Spring Loaded to Spool In (Pressure to A Port) Position
- J-S/C with MicroSwitch Bracket 2-Position (MicroSwitch not provided)
- K-S/C with MicroSwitch Bracket 1-Position (MicroSwitch not provided)

### PORT RELIEF "B" OPTION

- A-Relief Cavity Plugged
- B-Non-Adjustable Direct Acting Relief 1500-3000 PSI
- C-Non-Adjustable Direct Acting Relief 500-1500 PSI
- D-Anti-Cavitation Check
- E-Adjustable Combination Port Relief/Anti-Cavitation Check 1000-2500 PSI***
- F-Non-Adjustable Combination Port Relief/Anti-Cavitation Check 1000-2500 PSI***
- G-Adjustable Direct Acting Relief 1500-3000 PSI
- H-Adjustable Direct Acting Relief 500-1500 PSI

### PORT RELIEF "A" OPTION

- A-Relief Cavity Plugged
- B-Non-Adjustable Direct Acting Relief 1500-3000 PSI
- C-Non-Adjustable Direct Acting Relief 500-1500 PSI
- D-Anti-Cavitation Check
- E-Adjustable Combination Port Relief/Anti-Cavitation Check 1000-2500 PSI***
- F-Non-Adjustable Combination Port Relief/Anti-Cavitation Check 1000-2500 PSI***
- G-Adjustable Direct Acting Relief 1500-3000 PSI
- H-Adjustable Direct Acting Relief 500-1500 PSI

### CUSTOM SECTION

For OEM application custom sections can often be designed to meet your specifications. Special handles, spool, and spool actions are often easily made because of the SV valve’s flexible design. Consult your sales representative with your specifications.

TYPICAL STACK DIMENSIONAL DATA

THE ROD TORQUE
150 in-lbs +6 in - lbs
(12 1/2 ft - lbs +1/2)

ENCLOSED HANDLE, OPTIONS 11 AND 12

Durable die cast metal housing. Weather and oil resistant rubber boot. Reversible handle can be mounted in either a vertical or horizontal position. The extended handle option provides the necessary clearance for work port relief and lock cartridges. The extended handle option can also be used on the SVW and SVM, work sections when it is desired to keep handles aligned in an assembly with both low and high sections.

660180149 = Option 11, enclosed handle kit
660180151 = Option 12, extended enclosed handle kit
660180150 = handle kit for enclosed handle options (handle, knob, hex nut)
(handle kit is not included in the Option 11 or 12 kits above)

Handle option 11 (SVW & SVM)
Handle option 12 (SVH, SVL, SVS & SVR)
Parallel circuit sections are by far the most common. The SVW, SVM, SVF, SVH, SVR, SVG and SVL are all of parallel circuit construction. They can be combined together in any order in an assembly. When any one of the spools is shifted, it blocks off the open center passage through the valve. The oil then flows into the parallel circuit core making oil available to all spools. If more than one spool is fully shifted, the oil will go to the spool with the lowest pressure requirements. However, it is possible to meter the flow to the spool with the lease load and provide flow to two unequal loads.

**ENHANCED METERING SECTIONS**

The SVM, SVF, SVR and SVG sections have metering notches machined into the spool to allow for better “feathering” of a load. The spool travel for these sections is also a little longer at .281” vs. .250” for the standard sections. In addition to the metering notches in the spool, the lands in the SVF and SVG bodies have been machined to give more precise control over the flow. The metering notches in the SVF and SVG have been optimized for flows of 10 gpm or less. For enhanced metering on higher flows, it is recommended that the SVM or SVR be used.

**LOCK SECTIONS**

The SVL section combines both a 4-way directional valve and a double pilot operated check valve. This provides very low leakage when the spool is in neutral. When the spool is shifted, oil is directed through a work port check to the cylinder. Pressure on the work port applies pressure to the shuttle spool, opening the opposite check valve and allowing oil to return into the valve. Depending on load pressures, the metering of the spool may be affected. In some cases a one way restrictor in a work port may be beneficial.

---

**SERIES CIRCUIT SVS WORK SECTIONS**

A series circuit valve is most commonly used to control more than one hydraulic component simultaneously. The entire circuit flow is available to each valve section that is actuated. In a two spool series valve with both spools actuated, the oil flows from the inlet to the work port of the first section. The return flow of the first section is directed to the open center core of the second section. (In a parallel valve the return oil from the work port is directed to the tank core.) From the open center core of the second section, the oil flows to the work port with the return oil going to the outlet. In a series circuit valve, the summation of the pressures required for each work section will equal the total pressure required for the circuit. The total pressure required must not exceed the system relief setting or the pump pressure rating. It is not required to have a SV Series section as the last section, unless series flow is required to a downstream valve. In this application, a power beyond plug must be used in the outlet section.

**COMBINED SERIES / PARALLEL CIRCUITS**

The SV Series circuit valve sections may be stacked with SV parallel circuit valve sections. This allows both series and parallel control in the same valve assembly. In the valve assembly shown below, the first, third and fourth sections are parallel. The second section is series. The first parallel section has priority over all downstream valves. When the spool of the first parallel section is actuated, the return oil from the work port is directed to the tank core, thus oil flow to downstream sections is cut off. The second and third sections are in series with each other as is the second and fourth sections. The third and fourth sections are in parallel with each other.

**SERIES MOTOR SPOOL**

The SV Series Motor Spool provides control of reversible hydraulic motors. Both work ports are connected to the open center core in the neutral position. It should be noted that in the neutral position, the work ports will be equally pressurized to the same pressure that is required of any downstream valve sections and that a work port relief in the section will also limit the pressure of any other sections in the valve. The series motor spool should not be used to control a hydraulic cylinder as unwanted cylinder drift may occur in the neutral position.

**CLOSED CENTER APPLICATIONS**

The SV Series Circuit Valve sections cannot be used in a closed center valve assembly.
SV WORK PORT RELIEF*
SV WORK PORT RELIEFS, OPTION B, C, G, & H CAN BE ORDERED PRETESTED. USE ORDER CODE AT RIGHT

* Also used as standard main relief only models and RD4100 models.
SV INLET RELIEF OPTIONS

**OPTION 1 NO RELIEF**
This option provides no built-in relief. This is used when a relief is provided elsewhere in the system or in a closed center application. This plug can be replaced with a relief cartridge at a later date.

**OPTION 4 LOW PRESSURE ADJUSTABLE RELIEF**
This option provides for a differential poppet relief adjustable from 500-1500 PSI. Set at 1000 PSI @ 10 GPM.

**OPTION 5 HIGH PRESSURE ADJUSTABLE RELIEF**
This option provides for a differential poppet relief adjustable from 1500-3000 PSI. Set at 2000 PSI @ 10 GPM. The differential poppet relief provides smooth quiet operation with high cracking pressure.

RELIEF CARTRIDGES CAN BE ORDERED PRETESTED SEE RV-OX RELIEF, PAGE V67.

SV OUTLET COVER OPTIONS

**OPTION 3 CLOSED CENTER OUTLET**
This option provides for closed center operation. This is typically used with a variable displacement pressure compensated pump or in a system with an unloading valve. When the spools are in neutral the inlet is unloaded to tank. Closed center can also be accomplished by plugging the power beyond port of option 2.

**OPTION 6 OPEN CENTER OUTLET PRESSURE BUILD-UP VALVE FOR SOLENOID OPTION**
This option directs oil from open center core thru pressure build-up valve and then to tank. See solenoid section for description of operation.

**OPTION 7 POWER BEYOND PRESSURE BUILD-UP VALVE FOR SOLENOID OPTION**
This option directs oil from inlet thru pressure build-up valve and then downstream. This pressure build-up valve provides a #8 SAE power beyond port. The outlet must be connected to tank.

SV MID-INLET SECTION

**DESCRIPTION:**
A Mid-Inlet provides an inlet port for a second pump mid stream in the valve stack. A relief can be provided in this section. With the combined flow the flow from both pumps is available to the downstream sections when all the work sections upstream are in neutral. The split flow completely separates the two pump flows. The common tank passage is all that is shared between the two pump flows. **Note:** Split flow mid inlet is not available when used after a series section and the core block plate is not used after a series section.

24W - 24VDC Double Lead Wire w/ Weatherpak Connector Coil

FLOW CONTROL OPTION
M- Manual Flow Control
P- Electro-Proportional
U- Solenoid Unloading

The SVF Flow Control Inlet is interchangeable with the standard SV inlet section.

FLOW CONTROL OPTIONS:
P OPTION incorporates a solenoid operated, electrically variable pressure-compensated flow control cartridge. With the solenoid de-energized, all of the inlet flow is diverted to the tank core/EF port. By increasing the current through the solenoid, the flow directed to the power core and downstream sections will be proportionally increased, (the maximum rating of the cartridge is 16 gpm at 1500 mA) Control current is normally provided via a controller card providing, a PWM signal.

U OPTION incorporates a solenoid operated, unloader cartridge. With the solenoid de-energized, all of the inlet flow is diverted to the tank core/EF port. With the solenoid energized all the inlet flow is directed to the power core and downstream sections.

M OPTION incorporates a manually operated pressure-compensated flow control cartridge. With the control knob turned fully in (clockwise), all of the inlet flow is diverted to the tank core/EF port. By turning the flow control knob counter clockwise, the inlet flow directed to the power core and downstream sections is proportionally increased. Approximately 5 revolutions varies flow from no flow to full flow.

PORT OPTION 2 The flow being directed to the tank core/EF port may be utilized by a second circuit by inserting a 1/4 pipe plug into the tank core passage on the seal side of the casting and then connecting the EF port to the second circuit.

The proportional controller box is used to provide an adjustable electrical signal to a proportional solenoid on the SVIFP inlet. Once the dial is set, the regulated flow through the valve should remain approximately constant regardless of pressure. Within the operating range, flow varies approximately linearly with dial rotation.

CONNECTIONS AND OPERATION:
*Connect leads to the power supply and solenoid. Power supply should be between 9 and 32 VDC.
*With the power off, the inlet flow is directed to the tank (or excess flow port).
*To provide power to the control, move the power switch to ON. (Green LED is ON when control is powered).
*Minimum flow is directed into the valve when 0 on the dial is aligned with the center mark. Maximum flow is directed into the valve when 10 on the dial is aligned with the center mark.
*Clockwise rotation increases flow.
*Typically, no adjustments are needed for operation. (l-min and l-max pots are preset for the normal maximum and minimum flows)

Control comes with 6 ft of cable for power leads and 6 ft of cable for coil leads. Control box protection rating is IP67.
JOYSTICK HANDLE FOR MODEL SV STACK VALVE

This is a special handle for the model SV stack valve that allows the spools of two adjacent sections to be operated by one common handle. The spools can be operated independently or simultaneously depending on handle movement. The option is normally used on spring center to neutral sections, but can also be used on other sections such as float sections. This handle is normally installed on valves assembled at the factory but can be installed on work sections that have handle option 3 or 9. The drawing at right shows two joysticks with offset handles installed on a six section valve. When two joysticks are installed on the same valve assembly it is recommended that there be two standard sections between them to prevent handle interference. A two section spacer is available, part no. 660380002.

Please refer to these part numbers and state which sections the handle is to be installed on when ordering a valve assembly. This handle can be installed in the field to work sections with handle option 3 (no handle).

SV SOLENOID OPERATED
Work Sections

- Type “-D” and “-T” Solenoid Operated
- Type “-C” and “-S” Solenoid and Manual Operation

STANDARD FEATURES

- Open center or closed center applications
- Port relief options available
- Internal pilot supply and drain
- 12VDC, 24VDC and 120VAC
- Power beyond capability
- Load checks on each section
- May be stacked with Manual SV Sections
- 8 Series (“C” and “D”) more economical and compact

Differential Pressure

Required to Actuator: Approx. 150 PSI

Filtration: For general purpose valves, fluid cleanliness should meet the ISO 4406 19/17/14 level. For extended life or for pilot operated valves, the 18/16/13 fluid cleanliness level is recommended.
**SV (8 SERIES) SOLENOID OR MANUAL WORK SECTIONS (Both Solenoids on One End) Description of Operation**

The Type “C” SV Solenoid Work Section allows remote electrical on-off or manual control. The “C” sections are 8 series work sections which use screw in cartridges with a #8 thread size. The screw in cartridges provide a robust platform for the higher tank pressures often seen in mobile applications and the #8 size allows for a more compact section size. Cartridges and coils on the 8 series are not interchangeable with the Prince 10 series solenoid sections or sections manufactured prior to November 2014. Any of the standard “S”, “T”, “C” or “D” style Prince SV solenoid operated work sections may be used in any combination within a stack valve assembly.

The Type “C” SV Solenoid Section contains two 3-way 2-position, #8 solenoid cartridge valves and a pilot operated piston attached to the main control spool. When both solenoids are de-energized, both sides of the pilot piston are open to tank pressure and the spool remains spring centered. When solenoid “A” is energized, pilot pressure is applied to one side of the pilot piston, causing the spool to shift from the neutral position and direct flow to work port “A”. When solenoid “B” is energized, pilot pressure is applied to the other side of the pilot piston, causing the spool to shift and direct flow to work port “B”. An optional manual override feature is available for the solenoid cartridges.

Internal pilot lines provide pilot pressure to the solenoid actuator. Pilot pressure is generated by a “Pressure Build-Up Valve” that is installed in the standard outlet section. Two versions of the pressure build-up valve are offered, the open center pressure build-up valve and power beyond pressure build-up valve. Both versions supply 150-200 PSI pilot pressure to the solenoid actuator. A closed center assembly does not require a pressure build-up valve. For an open center system, the pilot pressure can also be provided by an in line manifold, which can provide filtered pilot flow.

**SV (8 SERIES) SOLENOID WORK SECTION (SOLENOID ON BOTH ENDS)**

**DESCRIPTION OF OPERATION**

The Type “-D” **SV Solenoid Work Section** allows remote electrical on-off control. The “-D” sections are 8 series work sections which use screw in cartridges with a #8 thread size. The screw in cartridges provide a robust platform for the higher tank pressures often seen in mobile applications and the #8 size allows for a more compact section size. Cartridges and coils on the 8 series are not interchangeable with the Prince 10 series solenoid sections or sections manufactured prior to November 2014. Any of the standard “-S”, “-T”, “-C” or “-D” style Prince SV solenoid operated work sections may be used in any combination within a stack valve assembly.

The Type “-D” **SV Solenoid Section** contains two 3-way 2-position, #8 solenoid cartridge valves, one at each end of the main valve body. When both solenoids are de-energized, both ends of the control valve spool are open to tank pressure and the spool remains spring centered. When solenoid “A” is energized, pilot pressure is applied to one end of the control valve spool causing the spool to shift from the neutral position to full stroke which directs flow to work port “A”. When solenoid “B” is energized, pilot pressure is applied to the other end of the control valve spool, causing the spool to shift to full stroke which directs flow to work port “B”. An optional manual override feature is available for the solenoid cartridges.

**Internal pilot lines** provide pilot pressure to the solenoid actuator. Pilot pressure is generated by a “Pressure Build-Up Valve” that is installed in the standard outlet section. Two versions of the pressure build-up valve are offered, the open center pressure build-up valve and power beyond pressure build-up valve. Both versions supply 150-200 PSI pilot pressure to the solenoid actuator. A closed center assembly does not require a pressure build-up valve. For an open center system, the pilot pressure can also be provided by an in inlet manifold, which can provide filtered pilot flow.

SV (10 SERIES) SOLENOID OR MANUAL WORK SECTIONS
(both solenoids on one end) DESCRIPTION OF OPERATION

The Type “-S” SV Solenoid Work Section allows remote electrical on-off or manual control. The “-S” sections are 10 series work sections which use screw in cartridges with a #10 thread size. Cartridges and coils on the 10 series will be interchangeable with the components on Prince solenoid operated valves manufactured prior to November 2014 as well as current production 10 series valves. Any of the standard “-S”, “-T”, “-C” or “-D” style Prince SV solenoid operated work sections may be used in any combination within a stack valve assembly.

The Type “-S” SV Solenoid Section contains two 3-way 2-position, #10 solenoid cartridge valves and a pilot operated piston attached to the main control spool. When both solenoids are de-energized, both sides of the pilot piston are open to tank pressure and the spool remains spring centered. When solenoid “A” is energized, pilot pressure is applied to one side of the pilot piston, causing the spool to shift from the neutral position and direct flow to work port “A”. When solenoid “B” is energized, pilot pressure is applied to the other side of the pilot piston, causing the spool to shift and direct flow to work port “B”.

Internal pilot lines provide pilot pressure to the solenoid actuator. Pilot pressure is generated by a “Pressure Build-Up Valve” that is installed in the standard outlet section. Two versions of the pressure build-up valve are offered, the open center pressure build-up valve and power beyond pressure build-up valve. Both versions supply 150-200 PSI pilot pressure to the solenoid actuator. A closed center assembly does not require a pressure build-up valve. For an open center system, the pilot pressure can also be provided by an in inlet manifold, which can provide filtered pilot flow.

SV (10 SERIES) SOLENOID WORK SECTION (SOLENOID ON BOTH ENDS)
DESCRIPTION OF OPERATION

The Type “-T” SV Solenoid Work Section allows remote electrical on-off control. The “-T” sections are 10 series work sections which use screw in cartridges with a #10 thread size. Cartridges and coils on the 10 series will be interchangeable with the components on Prince solenoid operated valves manufactured prior to November 2014 as well as current production 10 series valves. Any of the standard “-S”, “-T”, “-C” or “-D” style Prince SV solenoid operated work sections may be used in any combination within a stack valve assembly.

The Type “-T” SV Solenoid Section contains two 3-way 2-position, #10 solenoid cartridge valves, one at each end of the main valve body. When both solenoids are de-energized, both ends of the control valve spool are open to tank pressure and the spool remains spring centered. When solenoid “A” is energized, pilot pressure is applied to one end of the control valve spool causing the spool to shift from the neutral position to full stroke which directs flow to work port “A”. When solenoid “B” is energized, pilot pressure is applied to the other end of the control valve spool, causing the spool to shift to full stroke which directs flow to work port “B”.

Internal pilot lines provide pilot pressure to the solenoid actuator. Pilot pressure is generated by a “Pressure Build-Up Valve” that is installed in the standard outlet section. Two versions of the pressure build-up valve are offered, the open center pressure build-up valve and power beyond pressure build-up valve. Both versions supply 150-200 PSI pilot pressure to the solenoid actuator. A closed center assembly does not require a pressure build-up valve. For an open center system, the pilot pressure can also be provided by an in manifold manifold, which can provide filtered pilot flow.

SV SOLENOID OPERATED WORK SECTION - APPLICATION INFORMATION

For over center or light load applications if the required work port load pressure drops below 200 PSI, the pilot pressure to the spool will drop to the same pressure causing the spring to move the control spool back towards the neutral position. The spool will end up in an intermediate position between neutral and fully shifted. A restrictor installed in the work port or line may be required for this type of application.

For closed center applications the Pressure Build-Up Valve is not required. However, a system pressure of 200 PSI must be maintained in the closed center position to actuate the valve properly.

Proper operation of the solenoid actuators requires a pressure differential of 150-200 PSI above tank pressure. The maximum tank port pressure should not exceed 150 PSI. On “C” and “S” solenoid sections, excessive tank pressure will increase “Seal Drag” and may prohibit the spool from shifting.

The solenoid operated SV section may be converted to accept an external hydraulic pilot supply to the solenoid actuators. Please consult a Sales Representative for more information.

**RD532CCAAA5A4B1-25**

The last two digits are Relief pressure in hundreds
Example: 25=2500 psi, all relief settings are at 10 GPM & 105°F.

** *** Joystick handle will operate both spools using only one lever handle. The two spools can be operated either independently or simultaneously depending on handle movement.

** o Often used with no relief. Review application.

SEE PAGE 18 OF THE STANDARD PRODUCT PRICE LIST FOR PRICING
**STANDARD FEATURES**

- Economical monoblock construction of high tensile strength gray cast iron.
- Load check on each spool.
- Hard chrome plated spool.
- Optional 4 Position Float on 1st spool.
- Differential poppet style relief, adjustable from 1500 to 3000 psi (also available in low pressure version adjustable from 500 to 1500 psi)
- Power beyond and closed center capability.
- Reversible handle.

- MAXIMUM TANK PORT PRESSURE ............ 500 PSI
- RECOMMENDED SYSTEM FILTRATION.......ISO 4406 19/17/14
- FLOW RATING.......................... 30 GPM RD5100
- 25 GPM RD5200
- 25 GPM RD5300

WEIGHT ..................................... 14 LBS RD5100
- 23 LBS RD5200
- 34 LBS RD5300

**PARALLEL CIRCUIT VALVES:**
Both the RD-5200 Two-Spool and RD-5300 Three-Spool Valves are parallel circuit valves. When any one of the spools is shifted it blocks off the open center passage thru the valve. The oil then flows into the parallel circuit core making oil available to all spools. If more than one spool is fully shifted then oil will go to the spool with the lowest pressure requirements. However, it is possible to meter the flow to the spool with the least load and power two unequal loads.
### STDANT VALVES AVAILABLE:

All standard valves have end inlet and outlet locations, power beyond conversion plug, complete handle assemblies, and adjustable differential poppet relief.

- **Symbol RD516CA5A4C1**
- **Symbol RD526CCCA5A4C1**
- **Symbol RD536CCCA5A4C1**
**LOAD CHECK:**

The load check feature is standard on all RD-5000 series valves. Each spool has a separate load check. The load check will prevent the fall of a cylinder as the spool is shifted. It also prevents the back-flow of oil from the work port to the inlet. As shown below the pump must build up enough pressure to overcome the pressure on the work port caused by the weight of the load before the cylinder can move. **Please note** that the load check has nothing to do with how well the valve will hold up a cylinder with the spool in neutral. The load check is functional only when the spool is shifted.

**OPEN CENTER APPLICATIONS:**

The Standard RD-5000 Series Valves are open center type valves. For open center valves the hydraulic oil is directed from the inlet to the outlet, or power beyond, through the open center passage when the spools are in neutral. Moving one or more spools closes off the open center passage and directs oil to the work ports.

Open center systems most often contain fixed displacement pumps. The PMC hydraulic PTO pumps are fixed displacement gear pumps. The maximum pressure in an open center system is controlled by a relief valve. The RD-5000 series valves have a built in relief valve for this purpose.

RD-5000 Series spool options A, C, E and G are all open center spools when used with power beyond options A, B, C and F.

**CLOSED CENTER APPLICATIONS:**

RD-5000 Series Valves are available as closed center type valves. For closed center valves the oil through the open center passage is blocked when the spools are in neutral.

Closed center systems often use a variable displacement pressure compensated pump. When this type of pump is used in a closed center system the system pressure is controlled by the pressure compensator. When the spools of RD-5000 series valve are in neutral, system pressure is maintained at the inlet of the valve. For this reason a relief is normally not required or must be set at a higher pressure than the pump compensator. RD-5000 Series spool options C, E and G are converted to closed center by installing a closed center conversion plug, power beyond option D.

**PLEASE NOTE** that this closed center option does not provide for the drain off of standby spool leakage. This can allow a very small amount of oil to enter the work ports when in neutral.

The above drawing shows a section view thru work ports of a RD-5100 Single Spool Valve.
RD-5000 SERIES SPOOL OPTIONS

3 WAY 3 POSITION OPEN CENTER

This spool option is used to control a single acting cylinder or a unidirectional motor. In neutral the work port is blocked and oil goes through the open center passage to the next spool of a multi-spool valve or the power beyond of a single spool valve. The “A” port is plugged for this option.

4 WAY 3 POSITION TANDEM CENTER

This spool option is used to control a double acting cylinder or a reversing motor. In neutral both of the work ports are blocked and oil goes through the open center passage to the next spool of a multi-spool valve or the power beyond of a single spool valve. This is the most popular spool option and is used on most Prince standard valves.

4 WAY 3 POSITION CLOSED CENTER

This spool option is similar to spool option C except in neutral the open center passage is blocked. This function is achieved by using spool option C with a closed center conversion plug (Power beyond option D).

4 WAY 3 POSITION OPEN CENTER

This spool option can be used to control a bi-rotational motor or a double acting cylinder. In neutral the work ports are open to the return. This allows a cylinder to drift or a motor to coast to a stop. In neutral the oil goes through the open center passage to the next spool of multi-spool valve or the power beyond of a single spool valve.

4 WAY 3 POSITION CLOSED CENTER

This option is similar to spool option E except in neutral the open center passage is blocked. This function is achieved by using spool option E with a closed center conversion plug (Power beyond option D).

4 WAY 4 POSITION OPEN CENTER

This option is the same as spool option C, 4 way 3 position tandem, with an added fourth “float” position. In neutral the work ports are blocked (this will hold up a cylinder) and the oil goes through the open center passage to the next spool or power beyond. In the float position the work ports are open to the return (this will allow a cylinder to drift or “float”) and the oil goes to next spool or power beyond. The float position is reached by pushing the spool as far as it will go and is held in place by a detent. This option must be ordered with spool action option G.

RD-5000 SERIES SPOOL ATTACHMENT OPTIONS

3 POSITION SPRING CENTER TO NEUTRAL OPTION A

This option has 3 positions and a spring that returns the spool to neutral when the handle is released. This option is considered standard on many Prince valve models.

This option can be converted in the field to 3 position detent by ordering Kit 660150002. It can be converted to friction detent by ordering Kit 660150003.

3 POSITION DETENT OPTION B

This option provides three detented positions. The spool will remain in any of the three positions in which it is manually placed. No centering spring is provided. Note: This option does not positively lock the spool in place. Excessive vibration or shock loads may affect operation.

This option can be converted in the field to spring center by ordering Kit 660150001. It can be converted to friction detent by ordering Kit 660150003.

FRICTION DETENT OPTION C

This option provides for a detent in the neutral position only. As the spool is manually moved away from the neutral position it will be held in place by the friction of the detent balls on the detent sleeve. Note: Because the spool is held in place by friction only, excessive vibration may cause spool to move when not in the neutral detented position.

This option can be converted in the field to spring center by ordering Kit 660150001 and to 3 position detent by ordering Kit 660150002.

4 POSITION SPRING CENTER TO NEUTRAL DETENT SPOOL ‘IN’ FOR FLOAT POSITION OPTION G

This attachment is used with spool option G. This option provides for spring center to neutral from either work position. It also provides a 4th position, float detent. The float detent is reached by pushing the spool in as far as it will go. In the float position both work ports are open to return. This allows a cylinder to drift or “float”.

This option is available only with spool option G and cannot be added to a valve in the field.

PRESSURE RELEASE DETENT, DETENT SPOOL ‘OUT ONLY’, SPRING CENTER TO NEUTRAL OPTION E

This option provides a pressure release detent for the spool ‘Out’ position. When the spool is manually placed in the detent position oil is directed to the ‘B’ work port (the port away from the handle). When the pressure in the ‘B’ port reaches a preset level the detent will release and the spool will center. The detent release pressure is factory set at 1400 psi. This pressure is adjustable from 1000 to 2000 psi. The detent release pressure is adjusted by turning the adjusting screw clockwise to increase the pressure and counter-clockwise to decrease the pressure. The spool is spring centered to neutral from the spool ‘In’ position. This option can be used with spool options A, C or E.

This option can not be added to a valve in the field.

PRESSURE RELEASE DETENT, DETENT SPOOL ‘IN’ AND ‘OUT’ SPRING CENTER TO NEUTRAL OPTION F

This option is similar to option E above except the pressure release detent function is on both the spool ‘In’ and ‘Out’ positions. This option is available on RD-5100 valve and number 1 spool of RD-5200 and RD-5300 valves.

This option can be used with spool options C or E. This option can not be added to a valve in the field.

1 POSITION DETENT SPOOL ‘OUT’ SPRING CENTER TO NEUTRAL OPTION N

This option uses the same parts as option E above but is not pressure released. The handle must be manually removed from the detent position. The detent holding force is adjustable.

2 POSITION DETENT SPOOL ‘IN’ AND ‘OUT’ SPRING CENTER TO NEUTRAL OPTION P

This option uses the same parts as option F above but is not pressure released. The handle must be manually removed from the detent position. The detent holding force is adjustable.
**RD-5000 SERIES POWER BEYOND OPTIONS**

**ROTARY ACTUATOR OPTION D**
With this option, rotating the spool approximately 90° clockwise from neutral moves the spool to the full in position, 90° counter clockwise to full out. There is a detent in the neutral position, and in this position, the spool clevis opening is approximately vertical. A handle is not included. This option cannot be added in the field.

**POWER BEYOND NOT PROVIDED OPTION A**
This option provides an outlet only with no provision for power beyond. This option can be used with any open center spools where there is no need for a power beyond port. The end outlet, shown at right, is considered standard but a top or bottom outlet can also be specified.

When all the valves spools are in neutral oil goes through the open center core to the outlet. This option cannot be converted in the field to have power beyond. It also cannot be converted from open to closed center.

**CONVERSION PLUG INSTALLED OPTION B**
This option is similar in function to Option ‘A’ above except the conversion plug is installed in the power beyond location and the end outlet is relocated. This option should be used with the open center spool options and allows the valve to be converted to have power beyond function or be converted from open to closed center. This option is considered the PMC Standard power beyond option because of the flexibility it adds to the valve.

When all the valve spools are in neutral oil goes through open center core to return core and then to outlet.
To convert a valve in the field to have power beyond, remove the conversion plug and replace it with one of the power beyond plugs listed. To convert valve to closed center, replace conversion plug with closed center plug 660312005.

**POWER BEYOND PLUG INSTALLED OPTION C 3/4 NPTF POWER BEYOND PORT**
This option provides both an outlet and a power beyond port (also referred to as a high pressure carry over port). This allows another valve to be connected downstream. When all the spools of a RD-5000 series valve are in neutral high pressure oil can go through the open center core and out the power beyond port to the inlet of downstream valve. The downstream valve only receives oil when all spools of the first valve are in neutral. This option must be used with open center spools and the outlet of valve must be connected to tank.

If the power beyond port is not used on a valve in an open center system the power beyond port must be connected to tank or the power beyond plug replaced with conversion plug 660312003.
A valve with power beyond can be converted to closed center by plugging the power beyond port or installing closed center plug 660312005.

**CLOSED CENTER CONVERSION PLUG INSTALLED OPTION D**
This option converts an otherwise open center valve to closed center operation. The open center core is blocked by the conversion plug. Oil cannot pass through the valve when the spools are in neutral. Closed center systems are normally associated with variable displacement pumps or any other system where the pump flow is unloaded when system pressure is reached.

Note: If the closed center plug is installed in a valve that has a relief it may be necessary to install the no relief plug or adjust the relief pressure above the compensator setting.
Also, this closed center option does not provide for the drain off of standby spool leakage. This can allow a very small amount of oil to enter the work ports when in neutral.

---

**RD-5000 2 SPOOL SPECIAL APPLICATION VALVE**

**“AUTO-CYCLE” TWO SPOOL VALVE**
This valve is a modified RD-5200 two spool valve that can be used to automatically cycle a hydraulic cylinder. The spools and the valve body have been modified to provide this function. Both spools have the pressure release detent spool attachment. The valve is shown connected to a cylinder in the sketch below. The “B” port is connected to the base of the cylinder. The “A” and “D” ports are tied together and connected to the rod end of the cylinder. The “C” port is plugged. At the beginning of the cycle the cylinder is fully retracted. To begin the cycle both handles are pulled back. Oil is directed to the “B” port and the cylinder will extend until it reaches the end of its stroke. At this point the pressure will build to the detent release pressure and the first spool will center to neutral. Now the oil will go through the open center core to the second spool and is directed out the “D” port to retract the cylinder. When the cylinder reaches the full retract position the pressure will build to the detent release pressure and the second spool will center to neutral. This completes the cycle. To begin the next cycle both handles are again manually pulled back. Please note this valve does not have the loadcheck feature of the standard RD5200 valve. Also the “B” port is open to tank in neutral. Maximum detent pressure setting is 2000 PSI.

Model Number RD525MMEES5A4B1

RD5000 SERIES VALVE WITH PROPORTIONAL OPERATORS
The RD5000 valve is available with proportional solenoid operators. The valve will allow controlled starts and stops of the work port flow as well as control of the work port flow rate over a limited metered range. Pilot pressure to initiate spool shift is provided internally by means of a pressure build-up cartridge in the power beyond port. Once the spool shift is initiated, load induced pressure is required to regulate the spool position and flow. By increasing the current through one of the solenoids, increasing pressure is applied to a spool end, causing the spool to shift against spring bias. Full spool shift is at approximately 1200 mA - 12 VDC (600 mA - 24 VDC).

The RD5000 proportional operators are typically controlled with a thumb or handle control and a PWM control module. Prince offers a small thumb control joystick (671300076) and a larger handle control joystick (671300077). A PWM control module (671300075) that can be used in conjunction with these joysticks is also offered by Prince. The control module provides a performance enhancing dither to the current. The minimum and maximum current from the module can also be set to minimize the dead band before work port flow starts and to maximize the control resolution. Additional controls are available. Please contact sales at Prince Manufacturing for additional information.

The connector on the thumb joystick is a Molex #CGRID/SL (7 male pins). The connector on the handle joystick is a Deutsch #HD14-9-16P (9 male pins). The connector on the PWM control module is a Deutsch #DT04-8P (8 male pins). A harness is needed to connect the joystick, PWM module, and coils.

* RD516CA5A4H–DP12H–25
  The last two digits are relief pressure in hundreds (example: 25=2500 PSI). All relief settings are at 10 gpm & 105°F.
** Often used with no relief. Review application.

The last two digits are relief pressure in hundreds (example: 25=2500 PSI). All relief settings are at 10 gpm & 105°F.
**The Solenoid Operated RD5000 Directional Control Valve** allows remote electrical on-off or manual control. This feature can be installed on the RD5100, RD5200, or RD5300. It can be installed on one or all spools of the RD5200 or RD5300. This option can be purchased as kits and installed by customer. Complete valves are available special order only (min. qty. 25) Consult your sales representative.

**SPECIFICATIONS**

Maximum Pressure: 3000 PSI
Maximum Tank Pressure: 150 PSI
Maximum Flow: 25 GPM
Minimum Filtration: 10 Micron
Maximum Operating Temperature: 180°F

See drawings 660150072 through 660150083 for sample bills of materials.

The Solenoid Operated RD5000 contains two, 3 way-2 position solenoid cartridge valves and a pilot operated piston attached to the main control spool. When both solenoids are de-energized both sides of the pilot piston are open to tank pressure and the spool remains spring centered. When solenoid A is energized, pilot pressure is applied to one side of the pilot piston causing the spool to shift from the neutral position to work port A. When solenoid “B” is energized, pilot pressure is applied to the other side of the pilot piston causing the spool to shift to work port “B”. In cases where the pilot pressure is provided by the inlet line or #4 SAE port on valve, a “Pressure Build-Up Valve” must be installed in the outlet port. Two versions of the pressure build-up valve are offered. The open center pressure build-up valve and the power beyond pressure build-up valve. Both versions supply 150-200 PSI pilot pressure to the solenoid actuator. When remote pilot is used, the pressure build-up is not required. Because the valve is internally piloted, overcenter or light loads can be a problem. The inlet pressure must be at least 200 psi during operation. Restrictors can be added to eliminate this problem.
MODEL RD4100 SINGLE SPOOL MONO-BLOCK VALVE

RD4100 SPECIFICATIONS
MAXIMUM OPERATING PRESSURE ........................................ 3000 PSI
MAXIMUM TANK PRESSURE ............................................. 500 PSI
MAXIMUM OPERATING TEMPERATURE .............................. 180°F

RECOMMENDED SYSTEM FILTRATION ......................... ISO 4406 19/17/14
FLOW RATING ................................................................. 15 GPM

STANDARD FEATURES
- Economical monoblock construction of high tensile strength gray cast iron
- Load check
- Hard chrome plated spool
- Adjustable cartridge relief
- Open center, closed center, and power beyond available
- For use with system flows up to 15 gpm
- For use with system pressures up to 3000 PSI
- Optional top inlet & outlet port locations.

STANDARD VALVES AVAILABLE:
All standard valves have a load check, a complete lever handle assembly, and an adjustable relief, see table below for settings. For other relief settings, please specify.

ALL RELIEFS ARE SET AT 10 GPM.
REMOTE CABLE CONTROLS FOR PRINCE VALVES

Heavy duty remote cable controls are available for most Prince directional control valves. The compact controller bodies are of die-cast metal construction and are available in either dual axis or single axis configurations. Dual axis joysticks are constructed with steel swivels and anti-wear bushings. The high strength flexible control cables are jacketed and have quick attach connections.

REMOTE CONTROLLERS
- Dual Axis Joystick with lock: Prince Part No. 660170035
- Single Axis: Prince Part No. 660170039

CONTROL CABLES
- 49 inches long (1.25 M): Prince Part No. 660171125
- 59 inches long (1.5 M): Prince Part No. 660171150
- 79 inches long (2.0 M): Prince Part No. 660171200
- 89 inches long (2.25 M): Prince Part No. 660171225
- 98 inches long (2.5 M): Prince Part No. 660171250

VALVE CONNECTION KITS
- RD5000 series kit*: Prince Part No. 660170037
- LVS, LVR or LVT, kit (loader valves)**: Prince Part No. 660170029
- SV stack valve or RD4100 kit***: Prince Part No. 660170031
- Series 20 stack valve kit****: Prince Part No. 660170035

Note: One control cable and one connection kit is required for each spool controlled. Order the remote controller, the control cables and the connection kits as necessary to complete the remote cable control assembly.

* Field convertible or order option 3, less handle assembly.
** Order loader valve handle option 8, tang end only.
*** Field convertible from standard handle or order option 6, clevis spool end only.
**** Field convertible or order option 3, less complete handle.

SINGLE SPOOL CONTROL
Handle can be attached vertical as shown or horizontal

SEE PAGE 20 & 21 OF THE STANDARD PRODUCT PRICE LIST FOR PRICING
4 WAY 4 POSITION REGEN SPOOL OPERATION
This spool option allows for these four functions of the loader bucket cylinders: “NEUTRAL”, cylinder ports blocked to hold bucket in place; “BUCKET ROLLBACK” directs oil to hose 1 to retract bucket cylinder; “BUCKET TIP” directs oil to hose 2 to extend the bucket cylinder with full pressure (Please Note there is a soft stop at this handle position); “BUCKET REGEN” combines the oil from the tractor pump with the oil returning from hose 1 and it directs it to hose 2 to tip the bucket faster (referred to as REGENERATION or “REGEN”). It is necessary to push the handle past the soft stop at the normal bucket tip position to get to the regen position. Also Please Note that the cylinder force will be reduced when in the regen position.

4 WAY 4 POSITION FLOAT SPOOL OPERATION
This spool option allows for these four functions of the loader boom cylinders: “NEUTRAL”, cylinder ports blocked to hold boom in place; “BOOM RAISE” directs oil to hose 3 to extend boom cylinders; “BOOM LOWER” directs oil to hose 4 to retract the boom cylinders with full pressure (Please Note there is a soft stop at this handle position); “BOOM FLOAT” connects all boom cylinder ports to tank allowing the boom to fall to the ground. It is necessary to push the handle past the soft stop at the normal boom down position. There is a detent that will hold handle in the float position. While in the float position the loader boom cylinders will move up and down or “FLOAT” to match the ground level as the tractor moves forward or backward.

Joystick Handle
The joystick handle will operate both spools using one lever handle. The two spools can be operated independently or at the same time depending upon handle movement. Because we allow for maximum mounting flexibility, we have 4 options for the LVT, 2 options for the LVS and 4 options for the LVR. The handle shift pattern for all is shown at right.

LOG SPLITTER CONTROL VALVE

Model LS3000

SINGLE SPOOOL MONO-BLOCK 20GPM

Model RD2500
MODEL LS3000 DIMENSIONAL DATA

On LS-3000 Models, pressure release detent is in the spool out position.
On LS-3060 Models, pressure release detent is in the spool in position.

STANDARD FEATURES
• Hydraulically balanced, hard chrome plated spool
• Handle can be installed in “up” or “down” position
• Detent release pressure adjustable from 1000 to 2000 PSI
• For use with system flows up to 25 GPM
• Relief valve adjustable up to 2750 PSI
• Tandem center spool (in neutral position, both work ports blocked, pump unloaded to tank)
• Ideal for log-splitter applications. Available with 3/4” NPTTF work ports for higher flow applications

FUNCTION:
The Prince LSR-3060-3 log splitter valve features an extremely fast “Rapid Extend” high speed mode. The LSR has been specifically designed to reduce system costs by allowing a single stage pump to be used in systems currently using two stage (hi-low) pumps. When extra splitting force is required, the LSR allows the user to manually shift form high speed mode to high force mode. A “soft stop” differentiates between high force and high speed modes. Laboratory testing has not shown a significant difference in working cycle times between single stage/rapid extend systems and two stage systems. (Working cycle is the average time between extending the cylinder to split the first log and extending to split the next log after the split wood has been removed and a new log has been placed on the log splitter.)

SPECIFICATIONS:
1. Max design and test pressure 2750 PSI
2. Max tank port pressure-150 PSI
3. Flow rating-25 GPM max.
4. Relief valve setting-2250 PSI
5. This valve has one position pressure release detent with spring center to neutral.
6. Weight: 10 lbs.
7. Recommended filtration-ISO 4406 19/17/14
8. Max operation temp-180°F
9. In exposed environments do not mount with spool vertical and handle end down.

MODEL LSR-3060 RAPID EXTEND LOG SPLITTER VALVE

STANDARD FEATURES
• Hydraulically balanced, hard chrome plated spool
• Handle can be installed in “up” or “down” position
• Extend flows of up to 25 GPM with inlet flows of 4 GPM
• Relief valve adjustable up to 3500 PSI
• Tandem center spool
• Manual shift from high speed mode to high force mode
• Spring center 4 position spool with soft stop
• Pressure release detent on retract

SPECIFICATIONS:
1. Max design and test pressure 3500 PSI
2. Max tank port pressure -150 PSI
3. Nominal inlet flow rating 4 gpm
4. Standard relief valve setting – 2250 psi
5. This valve has a pressure release detent from spool in w/ spring center to neutral
6. The valve has a 4 position spool with normal extend and retract positions and a 4th rapid extend position
7. Max operating temperature - 180°F
8. In exposed environments, do not mount with spool in the vertical position
9. Dimensionally similar to the LS3000 valve
10. In center position, B port connected to tank.
MODEL RD2500 DIMENSIONAL DATA

STANDARD FEATURES
- Economical monoblock construction of high tensile strength gray cast iron
- Load check
- Hard chrome plated spool
- Adjustable ball spring relief (1000 PSI to 3000 PSI)
- Open center to closed center conversion available on some models
- For use with system flows to 20 GPM
- For use with system pressures to 3000 PSI

SPECIFICATIONS:
1. Max design and test pressure 3000 PSI
2. Max tank port pressure-150 PSI
3. Flow rating-20 GPM max.
4. Relief valve setting-1500 PSI
5. Weight: 9.5 lbs.
6. Recommended filtration-ISO 4406 19/17/14
7. Max operation temp-180°F
8. In exposed environments, do not mount with spool vertical and handle end down.

RD-2555-T4-ESA 1 PARTS BREAKDOWN

NON-STANDARD RELIEF SETTINGS RD2575-T4-ESA1-25

THE LAST TWO DIGITS ARE THE RELIEF SETTING IN HUNDREDS. Ex: 25=2500 PSI @ 12 GPM. ALL RELIEFS ARE SET AT 12 GPM.

NOTE: The Spool is select fit to the valve body at the factory and therefore body and spool are not available as repair parts.

### 4 WAY SPOOL

This spool option is used to control a double acting cylinder. In neutral both of the work ports are blocked and oil goes through the open center passage to the outlet. This is the most popular spool option.

### 3 WAY SPOOL

This spool option is used to control a single acting cylinder or a uni-directional motor. In neutral the work port is blocked and oil goes through the open center passage to the outlet. The "B" work port is plugged for this option.

### 4 WAY MOTOR SPOOL

This spool option is used to control a reversing motor or a double acting cylinder. In neutral the work ports are connected to tank and oil goes through the open center passage to the outlet. This allows a motor to free-wheel or a cylinder to float in the neutral position.

### LOAD CHECK

The load check feature is standard on all RD-2500 valve models. The load check will prevent the fall of a cylinder as the spool is shifted. It does this by preventing the back-flow of oil from work port to inlet. The pump must build up enough pressure to overcome the pressure on the work port and lift the load check poppet. The load check has nothing to do with holding a cylinder when the spool is in neutral.
DESCRIPTION:
This valve is a screw-in cartridge style, pressure compensated fixed-flow priority flow regulator. The valve delivers a constant flow to the priority port regardless of pressure on the secondary or primary circuit. All ports can be fully pressurized.

SPECIFICATIONS
MAXIMUM PRESSURE ..................... 3000 PSI
MAXIMUM INLET FLOW .................. 15 GPM
MAXIMUM CONTROL FLOW ................ 5 GPM
FLOW ACCURACY 1.5 to 5 GPM ................ ±10 %
MAXIMUM TEMPERATURE .................. 180°F
RECOMMENDED FILTRATION ...ISO 4406 17/14/19
THE CARTRIDGE IS ALL STEEL CONSTRUCTION
THE VALVE BODIES ARE HIGH STRENGTH ALUMINUM
INSTALLATION TORQUE 10-12 FT-LBS

FOR PRIORITY FLOW SETTINGS OR PORT SIZES NOT LISTED, CONTACT YOUR SALES REPRESENTATIVE.
PRESSURE COMPENSATED
ADJUSTABLE FLOW CONTROL VALVES

MODEL RD-100
TOP PORT FLOW CONTROL

The PRINCE valve models RD-100 and RD-1900 are pressure compensated adjustable flow control valves. By rotating the handle, the flow out the “CF”, or controlled flow port, can be varied from approximately 0 to the maximum controlled flow shown in the chart below. Any remaining flow is bypassed to the “EF” or excess flow port. This flow can be used to power another circuit or can be returned to tank. Once the controlled flow is set it will remain nearly constant with variations in pressure on either the controlled or excess flow ports.

Please note: If during operation the controlled flow port is blocked the valve will compensate in such a way as to shut off flow to the excess port.

These valves can also be used as a restrictive flow control by plugging the excess flow port.

The PRINCE valve models RDRS-100 and RDRS-1900 have a built in adjustable pressure relief. For these models the excess flow port must be connected to tank.

It should be noted that whenever these or any valve is used to bypass or restrict, flow heat will be generated. Steps may be required to keep oil temperature from becoming too high.

VALVE SPECIFICATIONS:
- Capacity: 30 gpm max inlet flow
- Pressure: 3000 psi max
- Weight: RD-100 8 lbs.
- RD-1900 9 lbs.

MODEL RD-100

APPLICATIONS:
As illustrated in the circuit below the RD-100/RD-1900 adjustable flow control valves can be used to control the speed of a hydraulic motor. In this circuit oil from a source is directed into the inlet of the valve. By moving the handle the flow can be varied from approximately zero when handle is vertical to maximum when the handle is horizontal. Oil not going to the controlled flow port is bypassed to the excess flow port where it can be used to supply another circuit or returned to tank. Instead of the control flow directly supplying a motor it can be used as a adjustable priority divider and provide adjustable priority flow to a directional control valve bank. Also as illustrated the RD-100/RD-1900 can be used as a restrictive type flow control. In this circuit the excess flow port is blocked. This would normally be used with a pressure compensated pump or in a closed center system.

CATV 62-07-13-02
CONSTANT VOLUME PRIORITY DIVIDERS

MODEL RD-400
FIXED FLOW PRIORITY DIVIDER

The PRINCE model RD-400 is a constant volume priority divider. It can be used in applications where two circuits are to be supplied by a single pump such as power steering systems. In operation the flow of oil supplied to the inlet is divided into two flows, the priority flow and the excess flow. The priority flow will remain nearly constant with variations in pressure on either the priority or excess flow port and will also remain nearly constant with variations in the inlet flow.

The priority flow GPM is determined by a fixed orifice inside the main spool. The desired priority GPM must be specified with model number, see below. The PRINCE model RD-400R provides the same function as described above with the addition of a built in pressure relief for the priority port only. This relief is internally adjustable and requires a separate line to tank. The relief is factory set at 1500 PSI.

VALVE SPECIFICATIONS:
Capacity: 30 gpm max inlet flow Weight: RD-400 7 lbs.
Pressure: 3000 psi max RD-400-R 7.5 lbs.

To complete the model number fill in the blank with the desired priority GPM from the list at right.
EX: RD-400-3 for 3 GPM priority flow; RD-405R-6 for 6 GPM priority flow.

MODEL RD-400 R
FIXED FLOW PRIORITY DIVIDER WITH PRIORITY PRESSURE RELIEF

MODEL RD-500
ADJUSTABLE FLOW PRIORITY DIVIDER

The PRINCE model RD-500 is an adjustable constant volume priority divider. This valve provides the same function as the PRINCE model RD-400 except the priority flow is adjustable from 2 GPM to 12 GPM. The priority flow is set using the adjusting screw and is then locked in place to maintain setting. This allows setting to be fine tuned in the field to the exact flow needed.

VALVE SPECIFICATIONS:
Capacity: 30 gpm max inlet flow
Pressure: 3000 psi max
Weight: 7 lbs.

PRESSURE COMPENSATED PROPORTIONAL FLOW DIVIDERS

The PRINCE model RD-200 valve is a pressure compensated proportional flow divider. The standard models of this valve will take one inlet flow and split it into two nearly equal outlet flows. The valve is also available with special ratio spools which will split the flow into two flows proportional to the ratio specified. Because the valve is pressure compensated the valve will maintain the divider ratio with quite different loads on the outlet ports as long as the inlet flow is within the range given in the chart below. Flow through the RD-200 cannot be reversed.

The PRINCE model RD-300 provides the same function as the RD-200 with the added feature of free reverse checks. This allows the reverse flow of oil from the outlet ports to the inlet port. The reverse flow is not pressure compensated.

VALVE SPECIFICATIONS:
Capacity: 30 gpm max inlet flow
Pressure: 3000 psi max
Weight: RD-200 7 lbs. RD-300 7 lbs.

In OEM quantities the RD-200 and RD-300 valves are available with special divider ratios. Ratios available are: 2:1, 80:20, 70:30, 60:40, and others as required. When ordering specify the divider ratio after the model number. EXAMPLE: RD-250-16 (70:30)

The PRINCE model RD-500P is a pressure compensated proportional flow divider valve with one fixed and one adjustable orifice. This valve provides the same function as the RD-200 except the divider ratio can be changed in the field.

VALVE SPECIFICATIONS:
Capacity: 30 gpm max inlet flow
Pressure: 3000 psi max
Weight: RD-500P 7 lbs.

The PRINCE valve model RD-1000S is an internally piloted adjustable sequence valve. This valve will prevent the flow of oil from going to the sequence port until the pressure on the inlet port reaches the sequence pressure. The sequence pressure is adjustable within the range given in chart below. A built in check valve allows flow from sequence port to inlet. To operate properly the drain port must be connected to tank. This valve is a spool type sequence valve and will provide smooth operation but should not be used in applications that require low leakage.

VALVE SPECIFICATIONS:
Capacity: 30 gpm max inlet flow
Pressure: 3000 psi max
Weight: 7 lbs.

DIFFERENTIAL POPPET STYLE
RELIEF VALVES - RV AND DRV SERIES

MODEL RV
DIFFERENTIAL POPPET
INLINE RELIEF

The PRINCE valve model RV is a differential poppet type inline relief. The valve is made up of a relief cartridge and a cast iron valve body. The differential poppet type relief provides smooth quiet performance with a minimum variation between cracking and full flow pressures. This type relief is also less sensitive to system contamination. The model RV is well suited as a system relief up to 30 GPM and 3000 psi. It is available in two pressure ranges and both an externally adjustable and shim adjustable version.

VALVE SPECIFICATIONS:
Capacity: 30 gpm max inlet flow
Weight: 3 lbs.
Pressure: 3000 psi max

MODEL DRV
DIFFERENTIAL POPPET
DOUBLE RELIEF

The PRINCE valve model DRV is a differential poppet type double relief. This valve uses the same relief cartridge as the model RV. The double relief is used in systems that require cross over relief protection such a reversible hydraulic motor, or systems that require a cushion valve such as double acting cylinders.

VALVE SPECIFICATIONS:
Capacity: 30 gpm max inlet flow
Weight: 5.5 lbs.
Pressure: 3000 psi max

MODEL RV-O
DIFFERENTIAL POPPET
RELIEF CARTRIDGE

The PRINCE valve model RV-O is the differential poppet relief cartridge used in many valve models. It is available preset to install into RV valves in the field or into a custom application. This relief cartridge can also be used in the RD5100, RD5200, RD5300 and SV stack valve inlet section.

VALVE SPECIFICATIONS:
Capacity: 30 gpm max inlet flow
Pressure: 3000 psi max

MODEL RD-1800 PRESSURE RELIEF
MODEL RD-900 SELECTOR VALVE

MODEL RD-1800
BALL/SPRING TYPE
DIRECT ACTING RELIEF

The PRINCE valve model RD-1800 is a direct acting ball/spring type pressure relief. The valve is compact and simple in design. This type relief is fast opening and is well suited for pressure spike protection. The performance curves below indicate the low cracking pressure typical to ball/spring reliefs. Please refer to the model RV relief for a system pressure relief. The valve is available with a standard steel seat, model RD-1800S, or with a hardened seat, model RD-1800H. Both models are externally adjustable.

VALVE SPECIFICATIONS:
Capacity: 20 gpm max inlet flow
Pressure: 2500 psi max
Weight: 2 lb.
Adjustment Range: 1000 PSI to 2500 PSI

STANDARD MODELS AVAILABLE

<table>
<thead>
<tr>
<th>MODEL #</th>

</tbody>
</table>

NOTE: Relief settings are 1500 PSI @ 12 GPM. For non-standard relief settings specify PSI in hundreds and GPM after model number. EX: RD-1850S-12-10 for 1200 PSI @ 10 GPM

MODEL RD-900
SELECTOR VALVE

The PRINCE valve model RD-900 is a manual 3-way 2-position selector valve. This valve will allow one pump source to supply two separate circuits. Pushing the handle in diverts oil flow to port away from handle. Pulling the handle out diverts oil flow to port nearest handle.

VALVE SPECIFICATIONS:
Capacity: 30 gpm max inlet flow
Pressure: 3000 psi max
Weight: 7 lbs.
MODEL SS SELECTOR

The PRINCE valve model SS is a manual 3-way 2 position selector valve. This valve will allow one pump source to supply two circuits. With the standard selector spool pulling the spool out diverts oil to port nearest handle, pushing the spool in diverts oil to the port away from the handle. The valve has an inlet on both the bottom and front of the valve body. Special options include lever handle and a float spool. The float spool connects the inlet to both outlets when the spool is pushed in and blocks both outlets when spool is pulled out.

**VALVE SPECIFICATIONS:**
- Capacity: 20 gpm max inlet flow
- Pressure: 2500 psi max
- Weight: 4 lbs.

SEE PAGE 23 & 24 OF THE STANDARD PRODUCT PRICE LIST FOR PRICING
MODEL DS DOUBLE SELECTOR VALVE

The PRINCE valve model DS is a manual 6-way 2 position double selector valve. This valve will divert the flow going to two separate hydraulic circuits. For example two double acting cylinders or two reversible hydraulic motors can be operated by one four-way valve. When the double selector spool is pushed in, the C and D ports (top ports) are connected to the A and E ports (right ports). When the selector spool is pulled out, the C and D ports are connected to the B and F ports (left ports). An optional series/parallel spool is also available. This spool will run two reversible hydraulic motors in series when the spool is out and in parallel when the spool is pushed in.

VALVE SPECIFICATIONS:
Capacity: 40 GPM max inlet flow
Pressure: 2500 psi
Weight: 9 lbs.

SPECIAL MODEL DS SELECTOR VALVES Other double selector valves not listed as standard are available in OEM quantities. To select a model number use the order code matrix below. Consult a sales representative if options other than those listed are required.

**PILOT-OPERATED CHECK VALVES**

### MODEL RD-1400
**LOCK VALVE DOUBLE PILOT-OPERATED**

The PRINCE valve model RD-1400 is a double pilot-operated lock valve. This valve will lock a cylinder in place when a directional control valve is in the neutral position. In operation oil is directed to one of the valve ports and oil can free flow to the corresponding cylinder port. The pressure on this valve port will shift the pilot spool opening the opposite check valve. This will allow oil to return through the opposite check valve. This valve has a hardened steel seat and steel ball and therefore should not be used in applications requiring absolutely zero leakage. When using a pilot operated check to lower a heavy load the valve may chatter. An orifice in the line in some cases may be beneficial.

- **Pressure:** 3000 psi max
- **Weight:** 7 lbs.
- **Pilot Ratio:** 4:1

### MODEL RD-1600
**PILOT OPERATED CHECK VALVE**

The PRINCE valve model RD-1600 is a pilot operated check valve. This valve blocks oil from flowing from the cylinder port to the valve port until sufficient pressure is applied to the pilot port. Oil can free flow from the valve port to the cylinder port. The valve has a two stage poppet allowing smooth chatter free operation.
